

FOR IMMEDIATE DISTRIBUTION
PRESS RELEASE

**After launching in CALIFORNIA, BONE Structure unveils
First Home in Metro Vancouver**

VANCOUVER, July 7th, 2016 – After successfully [unveiling Stanford Professor of Atmosphere and Energy Program Mark Z. Jacobson's home in California](#) last month, BONE Structure is proud to unveil its first project in the Metro Vancouver area, more precisely in North Vancouver.

Assembled using the [BONE Structure](#) technology, this custom home is not only extremely energy efficient and highly ecological, but points the way to a future where all homes are built to last.

Scheduled to be completed in 2016, this home features three levels that are divided in two living units. The main unit features 3 large bedrooms, each with an individual walk-in closet, 4 bathrooms, and an open living area. Access to the main floor terrace from the living room is provided by a large sliding door system with close to 20 ft. of glazing, offering incredible light and a great view of the mountain range in the distance.

The cellar level unit can be used as a mortgage helper or as quarters for a multi-generational family. It features 2 ample bedrooms and 1 bathroom, and the living area can access a large ground-level patio that extends the living space and bridges to the outside.

Yet the most striking feature of this home is its incredible energy efficiency and mechanical systems. Building on BONE Structure's incomparable thermal envelope, this home features a 10kw solar array on the roof to provide most of this home's energy needs, a rainwater system for irrigation and flushing as well as air and water radiant heat pumps. An electric vehicle charging station is also included, making this home incredibly efficient without compromising luxury or lifestyle.

- MEDIA INVITATION -
